# INSERT FLASH ELEMENTS IN THE EDITOR AS DYNAMIC CONTENT

Here's just a quick little piece of Dynamic Content I threw together yesterday together with a partner. It's for when you want editors to be able to insert flash elements directly in XHTML fields. A bit like inserting images – except that instead of an `<img>` tag we now want `<object>` and `<embed>` tags.

The code for this is fairly straightforward :

```
namespace EPiServer.Research.DynamicContent
{
    public class FlashDC : IDynamicContent
    {
        protected PropertyDocumentUrl1 flash;
        protected PropertyNumber width;
        protected PropertyNumber height;

        /// <summary>
        /// Setup properties
    }
}
```

And it's registrered in web.config like this:

```
<add description="Displays a flash element" name="FlashPlugin"
type="EPiServer.Research.DynamicContent.FlashDC, FlashDC"/>
```

Download the code and binary here.
