Listing all endpoints in Optimizely CMS 12 / .NET 5

.NET DEVELOPMENT. ADDON DEVELOPMENT. OPTIMIZEZY (EPISERVER)

Alan Thraen | 2 Months Ago | PDF |

Routing has significantly changed in .NET 5 - and that affects many parts of Optimizely (Episerver) CMS 12. For example we have to get used to endpoints a middleware. As I am working on upgrading a few different add-ons I found it could be useful to see which routes are registered out of the box.

I'm developing against a local Alloy site (yes, I'm old fashioned - but Foundation is still a bit too messy and introduces too many unknowns when developing add-ons, for my taste). I found this neat piece of controller code (<https://stackoverflow.com/questions/28435734/how-to-get-a-list-of-all-routes-in-asp-net-core>) and adjusted it slightly for my use, which will list all registered endpoints (routes) on the site.

```
[Route("/endpoints/")]
public class EndpointListController : Controller
{
    private readonly IEnumerable<EndpointDataSource> _sources;

    public EndpointListController(IEnumerable<EndpointDataSource> sources)
    {
        _sources = sources;
    }

    [HttpGet("list")]
    public async Task<ActionResult> ListEndpoints()
    {
        var endpoints = _sources.SelectMany(es => es.Endpoints).OfType<RouteEndpoint>();
        var output = endpoints.Select(ep =>
        {
            var controller = ep.Metadata
                .OfType<ControllerActionDescriptor>()
                .FirstOrDefault();
            var action = controller != null
                ? S"(controller.ControllerName){controller.ActionName}"
                : null;
            var controllerMethod = (controller != null)? S"controller.ControllerTypeInfo.FullName){controller.MethodInfo.Name}
                : null;
            return new{
                Method = ep.Metadata.OfType<HttpMethodMetadata>().FirstOrDefault()?.HttpMethods?[0],
                Route = S"/{ep.RoutePattern.RawText.TrimStart('/')}",
                Action = action,
                ControllerMethod = controllerMethod
            };
        });
        return Json(output, new JsonSerializerOptions { WriteIndented=true});
    }
}
```

When running it on my CMS 12, this is the output I get. I figured some of you might find it useful! At least it gives a good idea of where you want to dig in with dotPeak to figure out a useful approach (as the documentation still has some way to go).
